Abstract Integration

1.1 The Concept of Measurability

Definition 1.1.1

1. A collection $\mathfrak{M}$ of subsets of a set X is said to be a σ -**algebra** in X if $\mathfrak{M}$ has the following properties:
 - (a) $X \in \mathfrak{M}$.
 - (b) If $A \in \mathfrak{M}$, then $A^c \in \mathfrak{M}$.
 - (c) If $A = \bigcup_{n=1}^{\infty} A_n$ and $A_n \in \mathfrak{M}$ for $n = 1, 2, 3, \dots$, then $A \in \mathfrak{M}$.
2. If $\mathfrak{M}$ is a σ -algebra in X , then X is called a **measurable** provided that $f^{-1}(V)$ is measurable set in X for every open set V in Y .
3. If X is a measurable space, Y is a topological space, and f is a mapping of X into Y , then f is said to be **measurable** provided that $f^{-1}(V)$ is a measurable set in X for every open set V in Y .

Note.

对比 topological space 的定义, σ -algebra 的定义是对称的, 即可测集的补集仍是可测的, 而对于拓扑空间, 开集的补集不是开集, 而是被定义为了闭集这样的对象.

Lemma 1.1.2

1. Let X be a measurable space, Y, Z be topological spaces. If $f : X \rightarrow Y$ is measurable, and if $g : Y \rightarrow Z$ is continuous, then $g \circ f : X \rightarrow Z$ is measurable.
2. Let u, v be real measurable functions on a measurable space X , let Φ be a continuous mapping of the plane into a topological space Y , and define

$$h(x) = \Phi(u(x), v(x))$$

for $x \in X$. Then $h : X \rightarrow Y$ is measurable.

Proof. 1. Take any open subset $V \subseteq Z$. Then $g^{-1}(V)$ is an open subset of

Y . Since f is measurable,

$$(g \circ f)^{-1}(V) = f^{-1}(g^{-1}(V))$$

is a measurable set.

2. Let $V \subseteq Y$ be a open subset. Then $\Phi^{-1}(V)$ is a open subset of $[-\infty, \infty]^2$. There exists countably many open sets of $[-\infty, \infty] : U_i, V_i, i \in \mathbb{N}$, such that

$$\Phi^{-1}(V) = \bigcup_i U_i \times V_i$$

Thus

$$\begin{aligned} h^{-1}(V) &= (u, v)^{-1} \left(\bigcup_i U_i \times V_i \right) \\ &= \bigcup_i (u, v)^{-1}(U_i \times V_i) \\ &= \bigcup_i (u^{-1}(U_i) \cap v^{-1}(V_i)) \end{aligned}$$

which is a measurable set.

□

Corollary 1.1.3

Let X be a measurable space. The following propositions hold

1. If $f = u + iv$, where u and v are real measurable functions on X , then f is a complex measurable function on X .
2. If $f = u + iv$ is a complex measurable function on X , then u, v , and $|f|$ are real measurable functions on X .
3. If f and g are complex measurable functions on X , then so are $f + g$ and fg .
4. If E is a measurable set in X and if

$$\chi_E(x) = \begin{cases} 1 & x \in E \\ 0 & x \notin E \end{cases}$$

then χ_E is a measurable function.

5. If f is a complex measurable function on X , there is a complex measurable function α on X such that $|\alpha| = 1$ and $f = \alpha |f|$.

Theorem 1.1.4

If $\mathcal{F}$ is any collection of subsets of X , there exists a smallest σ -algebra $\mathfrak{M}^*$ such that $\mathcal{F} \subseteq \mathfrak{M}^*$.

Definition 1.1.5 ▶ Borel

Let X be a topological space.

1. By **Borel σ -algebra**, we mean the smallest σ -algebra $\mathcal{B}$ in X such that every open set in X belongs to $\mathcal{B}$. The members of $\mathcal{B}$ are called the **Borel sets** of X .
2. All countable unions of closed sets and all countable intersections of open sets are Borel sets, which we called F_σ 's **and** G_δ 's, respectively.
3. By a **Borel function**, we mean a measurable function on the measurable space $(X, \mathcal{B})$.

Remark.

1. The letters F and G were used for closed and open sets, respectively, and σ refers to union, δ to intersection.
2. A continuous function is Borel-measurable, since the preimage of any open set is open and therefore a Borel set.

Theorem 1.1.6

Suppose $\mathfrak{M}$ is a σ -algebra in X , and Y is a topological space. Let f map X into Y .

1. If Ω is the collection of all sets $E \subseteq Y$ such that $f^{-1}(E) \in \mathfrak{M}$, then Ω is a σ -algebra in Y .
2. If f is measurable and E is a Borel set in Y , then $f^{-1}(E) \in \mathfrak{M}$.
3. If $Y = [-\infty, \infty]$ and $f^{-1}((\alpha, \infty]) \in \mathfrak{M}$ for every real α , then f is measurable.
4. If f is measurable, if Z is a topological space, if $g : Y \rightarrow Z$ is a Borel mapping, and if $h = g \circ f$, then $h : X \rightarrow Z$ is measurable.

Theorem 1.1.7

If $f_n : X \rightarrow [-\infty, \infty]$ is measurable, for $n = 1, 2, 3, \dots$, and

$$g = \sup_{n \geq 1} f_n, \quad h = \lim_{n \rightarrow \infty} \sup f_n,$$

then g and h are measurable.

Corollary 1.1.8

1. The limit of every pointwise convergent sequence of complex measurable functions is measurable.
2. If f and g are measurable (with range in $[-\infty, \infty]$), then so are $\max\{f, g\}$ and $\min\{f, g\}$. In particular, this is true of the functions

$$f^+ = \max\{f, 0\}, \quad f^- = -\min\{f, 0\}.$$

which are called the **positive part** and **negative part** of f , respectively.

Remark.

1. There are the standard representation

$$|f| = f^+ + f^-, \quad f = f^+ - f^-$$

2. And easy but (may) useful observation is: If $f = g - h$, $g \geq 0$, $h \geq 0$, then $f^+ \leq g$ and $f^- \leq h$.

1.2 Simple Functions

Definition 1.2.1

A complex function s on a measurable space X whose range consists of only finitely many points will be called a **simple function**. Among these are the nonnegative simple functions, whose range is a finite subset of $[0, \infty)$.

Specifically, if $\alpha_1, \dots, \alpha_n$ are distinct values of a simple function s , and if we set $A_i = \{x : s(x) = \alpha_i\}$, then clearly

$$s = \sum_{i=1}^n \alpha_i \chi_{A_i}.$$

Where χ_{A_i} is the characteristic function of A_i .

Remark.

- Here, we explicitly exclude ∞ from the values of a simple function.
- It is clear that s is measurable if and only if each of the sets A_i is measurable.

Theorem 1.2.2

Let $f : X \rightarrow [0, \infty]$ be measurable space. There exists simple measurable functions s_n on X such that

1. $0 \leq s_1 \leq s_2 \leq \dots \leq f$.
2. $s_n(x) \rightarrow f(x)$ as $n \rightarrow \infty$, for every $x \in X$.

Proof sketch.

We construct a sequence of Borel simple functions $\{\varphi_n(x)\}$ to act as an **identity**. 当 n 增大的同时, 我们同时让 $\varphi_n(x)$ 的单位逼近精度和单位逼近范围随着 n 提升. 并且在舍弃误差时, 总是向下取整, 使得该单位逼近是自下而上的.

Proof. For every $x \in [0, \infty]$, and for every $n \in \mathbb{N}$, there exists a unique integer $k_n(x)$, such that

$$k_n(x) 2^{-n} \leq x < (k_n(x) + 1) 2^{-n}$$

For every $n \in \mathbb{N}$, we define

$$\varphi_n(x) = \begin{cases} k_n(x) 2^{-n}, & 0 \leq x \leq n \\ n, & x \geq n \end{cases}$$

Each $\varphi_n(x)$ is then a Borel simple function. It is not hard to show that $0 \leq \varphi_1 \leq \varphi_2 \leq \dots \leq \text{Id}$. For each n , we define

$$s_n(x) := (\varphi_n \circ f)(x)$$

Then $\{s_n\}$ is a sequence of simple measurable functions such that $0 \leq s_1 \leq s_2 \leq \dots \leq f$. Since $\lim_{n \rightarrow \infty} \varphi_n(x) = x$, then $\lim_{n \rightarrow \infty} s_n(x) = f(x)$. $\square$

1.3 Measure

Definition 1.3.1 ► Measure and Measure Space

- (a) A **positive measure** is a function μ , defined on a σ -algebra $\mathfrak{M}$, whose range is in $[0, \infty]$ and which is **countably additive**. This means that if $\{A_i\}$ is a disjoint countable collection of members of $\mathfrak{M}$, then

$$\mu\left(\bigcup_{i=1}^{\infty} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i).$$

To avoid trivialities, we shall also assume that $\mu(A) < \infty$ for at least one $A \in \mathfrak{M}$.

- (b) A **measure space** is a measurable space which has a positive measure defined on the σ -algebra of its measurable sets.
- (c) A **complex measure** is a complex-valued countably additive function defined on a σ -algebra.

Theorem 1.3.2

Let μ be a positive measure on a σ -algebra $\mathfrak{M}$. Then

1. $\mu(\emptyset) = 0$.
2. $\mu(A_1 \cup \dots \cup A_n) = \mu(A_1) + \dots + \mu(A_n)$ if $A_1, \dots, A_n$ are pairwise disjoint members of $\mathfrak{M}$.
3. $A \subset B$ implies $\mu(A) \leq \mu(B)$ if $A \in \mathfrak{M}, B \in \mathfrak{M}$.
4. $\mu(A_n) \rightarrow \mu(A)$ as $n \rightarrow \infty$ if $A = \bigcup_{n=1}^{\infty} A_n, A_n \in \mathfrak{M}$, and

$$A_1 \subset A_2 \subset A_3 \subset \dots$$

5. $\mu(A_n) \rightarrow \mu(A)$ as $n \rightarrow \infty$ if $A = \bigcap_{n=1}^{\infty} A_n, A_n \in \mathfrak{M}$,

$$A_1 \supset A_2 \supset A_3 \supset \dots,$$

and $\mu(A_1)$ is finite.

Proof. 1. Take $A \in \mathfrak{M}$ such that $\mu(A) < \infty$.¹ And let $A_2 = A_3 = \dots = \emptyset$, then $\mu(\emptyset) > 0$ leads to a contradiction to the countably additive.

2. Take $A_{n+1} = A_{n+2} = \dots = \emptyset$.

¹That is what we supposed at the definition of measure.

3. Note that $B = (B \setminus A) \cup A$, then by additivity

$$\mu(B) = \mu(A) + \mu(B \setminus A) \geq \mu(A)$$

4. Let $A_0 = \emptyset$, and let $B_n = A_n \setminus A_{n-1}$ for all $n \in \mathbb{N}$. Then $B_1, \dots, B_n$ are pairwise disjoint members of $\mathfrak{M}$ such that $A = \bigcup_{n=1}^{\infty} B_n$. We have

$$\mu(A) = \sum_{n=1}^{\infty} \mu(B_n) = \sum_{n=1}^{\infty} \mu(A_n \setminus A_{n-1})$$

If one of the $\mu(A_n)$ is ∞ , then $\lim_{n \rightarrow \infty} \mu(A_n)$ and $\mu(A)$ both are ∞ . Otherwise, we have

$$\mu(A_n \setminus A_{n-1}) = \mu(A_n) - \mu(A_{n-1}), \quad \forall n \in \mathbb{N}$$

Thus

$$\mu(A) = \sum_{n=1}^{\infty} \mu(A_n \setminus A_{n-1}) = \lim_{n \rightarrow \infty} \mu(A_n)$$

5. Let $B_n = A_n \setminus A_{n+1}$ for all $n \in \mathbb{N}$. $B_1, \dots, B_n$ are pairwise disjoint members of $\mathfrak{M}$ with finite measure, such that

$$A_1 \setminus A = A_1 \setminus \left(\bigcap_{n=1}^{\infty} A_n \right) = \bigcup_{n=1}^{\infty} (A_1 \setminus A_n) = \bigcup_{n=1}^{\infty} \left(\bigcup_{k=1}^n B_k \right) = \bigcup_{n=1}^{\infty} B_n$$

. We have

$$\mu(A_1 \setminus A) = \mu\left(\bigcup_{n=1}^{\infty} B_n\right),$$

where the RHS is $\mu(A_1) - \mu(A)$, and the LHS is

$$\sum_{n=1}^{\infty} (\mu(A_n) - \mu(A_{n+1})) = \mu(A_1) - \lim_{n \rightarrow \infty} \mu(A_{n+1})$$

Since $\mu(A_1) < \infty$, we have

$$\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$$

□

Example 1.3.3

1. For any $E \subset X$, where X is any set, define $\mu(E) = \infty$ if E is an infinite set, and let $\mu(E)$ be the number of points in E if E is finite. This μ is called the **counting measure** on X .
2. Fix $x_0 \in X$, define $\mu(E) = 1$ if $x_0 \in E$ and $\mu(E) = 0$ if $x_0 \notin E$, for any $E \subset X$. This μ may be called the **unit mass concentrated at x_0** .
3. Let μ be the counting measure on the set $\{1, 2, 3, \dots\}$, let $A_n = \{n, n+1, n+2, \dots\}$. Then $\bigcap A_n = \emptyset$ but $\mu(A_n) = \infty$ for $n = 1, 2, 3, \dots$. This shows that the hypothesis

$$\mu(A_1) < \infty$$

is not superfluous in Theorem 1.3.2(5).

1.4 Integration of Positive Functions

Definition 1.4.1 ▶ Integration of Positive Functions

1. If $s : X \rightarrow [0, \infty)$ is a measurable simple function, of the form

$$s = \sum_{i=1}^n \alpha_i \chi_{A_i},$$

where $\alpha_1, \dots, \alpha_n$ are the distinct values of s , and if $E \in \mathfrak{M}$, we define

$$\int_E s \, d\mu = \sum_{i=1}^n \alpha_i \mu(A_i \cap E).$$

The convention $0 \cdot \infty = 0$ is used here; it may happen that $\alpha_i = 0$ for some i and that $\mu(A_i \cap E) = \infty$.

2. If $f : X \rightarrow [0, \infty]$ is measurable, and $E \in \mathfrak{M}$, we define

$$\int_E f \, d\mu = \sup \int_E s \, d\mu,$$

the supremum being taken over all simple measurable functions s such that $0 \leq s \leq f$. The left member above is called the **Lebesgue integral** of f over E , with respect to the measure μ . It is a number in $[0, \infty]$.

Remark.

We apparently have two definitions for $\int_E f d\mu$ if f is simple, they are the same.

Corollary 1.4.2

- (a) If $0 \leq f \leq g$, then $\int_E f d\mu \leq \int_E g d\mu$.
- (b) If $A \subset B$ and $f \geq 0$, then $\int_A f d\mu \leq \int_B f d\mu$.
- (c) If $f \geq 0$ and c is a constant, $0 \leq c < \infty$, then

$$\int_E cf d\mu = c \int_E f d\mu.$$

- (d) If $f(x) = 0$ for all $x \in E$, then $\int_E f d\mu = 0$, even if $\mu(E) = \infty$.
- (e) If $\mu(E) = 0$, then $\int_E f d\mu = 0$, even if $f(x) = \infty$ for every $x \in E$.
- (f) If $f \geq 0$, then $\int_E f d\mu = \int_X \chi_E f d\mu$.

Remark.

We can also regard the $\int_E f d\mu$ as the restricted function $f|_E$ integrates on the induced measure space E .

Proposition 1.4.3

Let s and t be nonnegative measurable simple functions on X . For $E \in \mathfrak{M}$, define

$$\varphi(E) = \int_E s d\mu.$$

Then φ is a measure on $\mathfrak{M}$. Also

$$\int_X (s + t) d\mu = \int_X s d\mu + \int_X t d\mu.$$

Note.

$\varphi(E) = \int_E s d\mu$ 就是依据 s 对测度 μ 进行一个有限的算数的加权. 自然地也就成为一个测度.

Proof. If $E_1, E_2, \dots$ are disjoint members of $\mathfrak{M}$ whose union is E , the countable

additivity of μ shows that

$$\begin{aligned}
 \varphi(E) &= \sum_{i=1}^n \alpha_i \mu(A_i \cap E) \\
 &= \sum_{i=1}^n \sum_{j=0}^{\infty} \alpha_i \mu(A_i \cap E_j) \\
 &= \sum_{j=0}^{\infty} \sum_{i=1}^n \alpha_i \mu(A_i \cap E_j) \\
 &= \sum_{j=0}^{\infty} \varphi(E_j)
 \end{aligned}$$

Also, $\varphi(\emptyset) \neq \infty$, μ is not identically ∞ .

Next, let $\beta_1, \dots, \beta_m$ be distinct values of t . And let $B_j := \{x : t(x) = \beta_j\}$. Then

$$\begin{aligned}
 \int_X (s+t) \, d\mu &= \sum_{i,j} \int_{A_i \cap B_j} (s+t) \, d\mu \\
 &= \sum_{i,j} \alpha_i \mu(A_i \cap B_j) + \sum_{i,j} \beta_j \mu(A_i \cap B_j) \\
 &= \sum_i \alpha_i \mu(A_i) + \sum_j \beta_j \mu(B_j) \\
 &= \int_X s \, d\mu + \int_X t \, d\mu
 \end{aligned}$$

□

Theorem 1.4.4 ► Lebesgue's Monotone Convergence Theorem

Let $\{f_n\}$ be a sequence of measurable functions on X , and suppose that

(a) $0 \leq f_1(x) \leq f_2(x) \leq \dots \leq \infty$ for every $x \in X$,

(b) $f_n(x) \rightarrow f(x)$ as $n \rightarrow \infty$, for every $x \in X$.

Then f is measurable, and

$$\int_X f_n \, d\mu \rightarrow \int_X f \, d\mu \quad \text{as } n \rightarrow \infty.$$

Proof. Since $\int_X f_n d\mu \leq \int_X f_{n+1} d\mu$ for all n , there exists an $\alpha > 0$ such that

$$\int_X f_n d\mu \rightarrow \alpha, \quad \text{as } n \rightarrow \infty$$

By Theorem 1.1.7, f is measurable, then by $\int_X f_n d\mu \leq \int_X f d\mu \forall n$,

$$\alpha \leq \int_X f d\mu$$

Take any simple function $0 \leq s \leq f$, and $0 \leq c < 1$. Define

$$E_n^s := \{x \in X : f_n(x) \geq cs(x)\}$$

Then since $\varphi(E) := \int_E s d\mu$ is a measure,

$$\alpha \geq \lim_{n \rightarrow \infty} \int_X f_n d\mu \geq \lim_{n \rightarrow \infty} \int_{E_n^s} f_n d\mu \geq c \lim_{n \rightarrow \infty} \int_{E_n^s} s d\mu = c \lim_{n \rightarrow \infty} \varphi(E_n^s) = c\varphi(X)$$

That is

$$\alpha \geq c \int_X s d\mu$$

Since s is arbitrary,

$$\alpha \geq c \int_X f d\mu$$

and since c is arbitrary,

$$\alpha \geq \int_X f d\mu$$

which completes the proof. □

Corollary 1.4.5

Let $f, g : X \rightarrow [0, \infty]$ be measurable functions on X . Then $f + g$ is measurable and

$$\int_X (f + g) d\mu = \int_X f d\mu + \int_X g d\mu$$

Proof. Let $\{s_n\}, \{s'_n\}$ be simple function sequences in Theorem 1.2.2 of f, g ,

respectively . Then by the theorem above and the Proposition 1.4.3

$$\begin{aligned}\int_X (f + g) \, d\mu &= \lim_{n \rightarrow \infty} \int_X (s_n + s'_n) \, d\mu = \lim_{n \rightarrow \infty} \int_X s_n \, d\mu + \lim_{n \rightarrow \infty} \int_X s'_n \, d\mu \\ &= \int_X f \, d\mu + \int_X g \, d\mu\end{aligned}$$

□

Corollary 1.4.6

If $f_n : X \rightarrow [0, \infty]$ is **measurable**, for $n = 1, 2, 3, \dots$, and

$$f(x) = \sum_{n=1}^{\infty} f_n(x) \quad (x \in X),$$

then

$$\int_X f \, d\mu = \sum_{n=1}^{\infty} \int_X f_n \, d\mu.$$

Proof. Let $g_n(x) = \sum_{k=1}^n f_k(x)$. Then $g_1 \leq g_2 \leq \dots \leq \infty$ and $f = \lim_{n \rightarrow \infty} g_n(x)$. Applying Monotone Convergence Theorem to $\{g_n\}$ and f , we have

$$\int_X f \, d\mu = \lim_{n \rightarrow \infty} \int_X \sum_{k=1}^n f_k(x) \, d\mu = \lim_{n \rightarrow \infty} \sum_{k=1}^n \int_X f_k(x) \, d\mu = \sum_{k=1}^{\infty} \int_X f_k \, d\mu$$

□

Corollary 1.4.7

If $a_{ij} \geq 0$ for i and $j = 1, 2, 3, \dots$, then

$$\sum_{i=1}^{\infty} \sum_{j=1}^{\infty} a_{ij} = \sum_{j=1}^{\infty} \sum_{i=1}^{\infty} a_{ij}.$$

Proof. Let μ be counting measure on $\mathbb{Z}$. Let

$$f_i(j) = a_{ij}, \quad f(k) = \sum_{i=1}^{\infty} f_i(k) = \sum_{i=1}^{\infty} a_{ik}$$

By Monotone Convergence Theorem, for any measurable g ,

$$\int_{\mathbb{Z}} g \, d\mu = \int_{\mathbb{Z}} \lim_{n \rightarrow \infty} \chi(\{1, \dots, n\}) g \, d\mu = \lim_{n \rightarrow \infty} \int_{\mathbb{Z}} \chi(\{1, \dots, n\}) g \, d\mu = \sum_{k=-\infty}^{\infty} g(k)$$

Thus

$$\int_{\mathbb{Z}} f \, d\mu = \sum_{j=1}^{\infty} \sum_{i=1}^{\infty} a_{ij}$$

And we have

$$\sum_{i=1}^{\infty} \int_X f_i \, d\mu = \sum_{i=1}^{\infty} \sum_{j=1}^{\infty} a_{ij}$$

The above corollary shows that

$$\int_{\mathbb{Z}} f \, d\mu = \sum_{i=1}^{\infty} \int_X f_i \, d\mu$$

That is

$$\sum_{i=1}^{\infty} \sum_{j=1}^{\infty} a_{ij} = \sum_{j=1}^{\infty} \sum_{i=1}^{\infty} a_{ij}$$

□

Lemma 1.4.8 ► Fatou's Lemma

If $f_n : X \rightarrow [0, \infty]$ is **measurable**, for each positive integer n , then

$$\int_X \left(\liminf_{n \rightarrow \infty} f_n \right) d\mu \leq \liminf_{n \rightarrow \infty} \int_X f_n d\mu. \quad (1)$$

Note.

有了 Monotone Convergence Theorem 之后, 关键的不等式就剩下

$$\int_X \inf_{n \geq k} f_n d\mu \leq \inf_{n \geq k} \int_X f_n d\mu$$

它的含义是局部最小的积分小于等于积分的最小.

Proof. Let

$$g_k(x) = \inf_{n \geq k} f_n(x)$$

Then

$$\lim_{n \rightarrow \infty} \inf f_n = \lim_{n \rightarrow \infty} g_n =: g$$

where $\{g_k\}$, g are all measurable. It is obvious that $\{g_k\}$ is increasing. Thus

$$\lim_{n \rightarrow \infty} \int_X g_n d\mu = \int_X g d\mu = \int_X \left(\lim_{n \rightarrow \infty} \inf f_n \right) d\mu$$

Only need to show that

$$\int_X \inf_{n \geq k} f_n d\mu \leq \inf_{n \geq k} \int_X f_n d\mu$$

which is true since

$$\int_X \inf_{n \geq k} f_n d\mu \leq \int_X f_n d\mu, \text{ for all } n \geq k$$

□

Theorem 1.4.9

Suppose $f : X \rightarrow [0, \infty]$ is measurable, and

$$\varphi(E) = \int_E f d\mu \quad (E \in \mathfrak{M}).$$

Then φ is a measure on $\mathfrak{M}$, and

$$\int_X g d\varphi = \int_X gf d\mu$$

for every measurable g on X with range in $[0, \infty]$.

Note.

将 measurable function f 视为对 measure μ 的某种 countable 次算数加权操作. 那么得益于 μ 对 countable 操作的相容性, φ 也就成为一个测度. φ 的积分行为也验证了这种看法的合理性.

Proof. • Let $E_1, \dots, E_n, \dots$ be disjoint measurable sets such that $E = \bigcup_{n=1}^{\infty} E_n$. Then $\{\sum_{k=1}^n \chi_{E_k} f\}$ be increasing measurable function sequence such that $\lim_{n \rightarrow \infty} \sum_{k=1}^n \chi_{E_k} f = f$. The Monotone Convergence Theorem shows that

$$\begin{aligned} \sum_{n=1}^{\infty} \varphi(E_n) &= \lim_{n \rightarrow \infty} \sum_{k=1}^n \int_{E_k} f d\mu = \lim_{n \rightarrow \infty} \int_E \sum_{k=1}^n \chi_{E_k} f d\mu \\ &= \int_E f d\mu = \varphi(E) \end{aligned}$$

Since $\varphi(\emptyset) = 0$. φ is a measure on X .

- To show the second results. See that it is true for $g = \chi_E$. Thus it is true for g is a simple function. And the general case follows from the Monotone Convergence Theorem.

□

1.5 Integration of Complex Functions

Definition 1.5.1 ▶ Lebegsgue Integrability

We define $L^1(\mu)$ to be the collection of all complex measurable functions f on X for which

$$\int_X |f| d\mu < \infty.$$

Note that the measurability of f implies that of $|f|$, hence the above integral is defined.

The members of $L^1(\mu)$ are called *Lebesgue integrable functions* (with respect to μ) or *summable functions*.

Definition 1.5.2 ► Complex Integration

If $f = u + iv$, where u and v are real measurable functions on X , and if $f \in L^1(\mu)$, we define

$$\int_E f d\mu = \int_E u^+ d\mu - \int_E u^- d\mu + i \int_E v^+ d\mu - i \int_E v^- d\mu \quad (1)$$

for every measurable set E .

Remark.

We have $u^+ \leq |u| < |f|$, etc., so that each of these four integrals is finite. Thus (1) defines the integral on the left as a complex number.

Definition 1.5.3 ► Real Integration

Occasionally it is desirable to define the integral of a measurable function f with range in $[-\infty, \infty]$ to be

$$\int_E f d\mu = \int_E f^+ d\mu - \int_E f^- d\mu, \quad (2)$$

provided that at least one of the integrals on the right of (2) is finite. The left side of (2) is then a number in $[-\infty, \infty]$.

Theorem 1.5.4

Suppose f and $g \in L^1(\mu)$ and α and β are complex numbers. Then $\alpha f + \beta g \in L^1(\mu)$, and

$$\int_X (\alpha f + \beta g) d\mu = \alpha \int_X f d\mu + \beta \int_X g d\mu$$

Proof sketch.

可积性来自于模长的三角不等式. 主要证明可加性. 将 $f + g = h$ 的正负部分到两边, 就都变成了非负函数. 积分即可.

Theorem 1.5.5

If $f \in L^1(\mu)$, then

$$\left| \int_X f d\mu \right| \leq \int_X |f| d\mu.$$

Note.

被缩放的部分实际上是 f 因改变了方向产生的损耗.

Proof. Let $z = \int_X f d\mu$, z is a complex number. There exists a complex number α ($\alpha = \frac{\bar{z}}{|z|}$), such that $|\alpha| = 1$, and

$$\left| \int_X f d\mu \right| = \alpha z = \alpha \int_X f d\mu = \int_X \alpha f d\mu$$

Suppose $\alpha f = u + iv$, since $\int_X \alpha f d\mu$ is a real number, $\int_X v d\mu = 0$. We have

$$\int_X \alpha f d\mu = \int_X u d\mu \leq \int_X |\alpha f| d\mu = \int_X |f| d\mu$$

□

Theorem 1.5.6 ▶ Lebesgue's Dominated Convergence Theorem

Suppose $\{f_n\}$ is a sequence of complex measurable functions on X such that

$$f(x) = \lim_{n \rightarrow \infty} f_n(x)$$

exists for every $x \in X$. If there is a function $g \in L^1(\mu)$ such that

$$|f_n(x)| \leq g(x) \quad (n = 1, 2, 3, \dots; x \in X),$$

then $f \in L^1(\mu)$,

$$\lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu = 0,$$

and

$$\lim_{n \rightarrow \infty} \int_X f_n d\mu = \int_X f d\mu.$$

Proof sketch.

$\{f_n\}$ 不一定单调, 能将极限从积分外塞进积分里的工具, 目前我们只有 Fatou's Lemma, 但是它原始的样子跟我们需要的不等号是反向的. 自然的想法是填一个负号, 这又会导致函数失去非负性, 而控制函数 g 恰好能弥补这一点不足. 实现起来, 我们从 g 上扣去 f, f_n , 而非直接拿出 f, f_n 去做.

Proof. Since $|f| \leq g$ and f is measurable, $f \in L^1(\mu)$. Function $(2g - |f_n - f|)$ is a nonnegative measurable function. Applying Fatou's Lemma to it, we have

$$\int_X \liminf_{n \rightarrow \infty} (2g - |f_n - f|) d\mu \leq \liminf_{n \rightarrow \infty} \int_X (2g - |f_n - f|) d\mu$$

where

$$\liminf_{n \rightarrow \infty} (2g - |f_n - f|) = 2g - \limsup_{n \rightarrow \infty} |f_n - f| = 2g$$

$$\liminf_{n \rightarrow \infty} \int_X (2g - |f_n - f|) d\mu = 2 \int_X g d\mu - \limsup_{n \rightarrow \infty} \int_X |f_n - f| d\mu$$

The original inequality comes to

$$2 \int_X g d\mu \leq 2 \int_X g d\mu - \limsup_{n \rightarrow \infty} \int_X |f_n - f| d\mu$$

Since $\int_X g d\mu$ is finite, we can subtract $2 \int_X g d\mu$ both sides and get

$$\limsup_{n \rightarrow \infty} \int_X |f_n - f| d\mu \leq 0$$

Thus

$$\lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu = 0$$

Finally, we have

$$\begin{aligned} \left| \lim_{n \rightarrow \infty} \int_X f_n \, d\mu - \int_X f \, d\mu \right| &= \left| \lim_{n \rightarrow \infty} \int_X (f_n - f) \, d\mu \right| \\ &\leq \lim_{n \rightarrow \infty} \int_X |f_n - f| \, d\mu \\ &= 0 \end{aligned}$$

which completes the proof. □

1.6 The Sets of Measure Zero

Definition 1.6.1

Let P be a property which a point x may or may not have. If μ is a measure on a σ -algebra $\mathfrak{M}$ and if $E \in \mathfrak{M}$, the statement “ P holds **almost everywhere on** E ” (abbreviated to “ P holds a.e. on E ”) means that there exists an $N \in \mathfrak{M}$ such that $\mu(N) = 0$, $N \subset E$, and P holds at every point of $E - N$.

Remark.

This concept of a.e. depends of course very strongly on the given measure, and we shall write “a.e. $[\mu]$ ” whenever clarity requires that the measure be indicated.

Example 1.6.2

For example, if f and g are measurable functions and if

$$\mu(\{x : f(x) \neq g(x)\}) = 0,$$

we say that $f = g$ a.e. $[\mu]$ on X , and we may write $f \sim g$.

Remark.

This is easily seen to be an equivalence relation. The transitivity ($f \sim g$ and $g \sim h$ implies $f \sim h$) is a consequence of the fact that the union of two sets of measure 0 has measure 0.

Proposition 1.6.3 ▶ Completion of a Measure

If $f \sim g$, then, for every $E \in \mathfrak{M}$,

$$\int_E f d\mu = \int_E g d\mu.$$

Theorem 1.6.4

Let $(X, \mathfrak{M}, \mu)$ be a measure space, let $\mathfrak{M}^*$ be the collection of all $E \subset X$ for which there exist sets A and $B \in \mathfrak{M}$ such that $A \subset E \subset B$ and $\mu(B - A) = 0$, and define $\mu(E) = \mu(A)$ in this situation. Then $\mathfrak{M}^*$ is a σ -algebra, and μ is a measure on $\mathfrak{M}^*$.

Remark.

This extended measure μ is called **complete**, since all subsets of sets of measure 0 are now measurable; the σ -algebra $\mathfrak{M}^*$ is called the **μ -completion** of $\mathfrak{M}$. The theorem says that every measure can be completed, so, whenever it is convenient, we may assume that any given measure is complete; this just gives us more measurable sets, hence more measurable functions.

Proof. We begin by checking that μ is well defined for every $E \in \mathfrak{M}^*$. If for $i = 1, 2$, $A_i \subseteq E \subseteq B_i$, where $A_i, B_i \in \mathfrak{M}$, $\mu(B_i - A_i) = 0$. We need to show that $\mu(A_1) = \mu(A_2)$. Since $A_1 \subseteq E \subseteq B_2$,

$$\mu(A_1) \leq \mu(B_2) = \mu(A_2) + \mu(B_2 - A_2) = \mu(A_2)$$

By symmetric,

$$\mu(A_2) \leq \mu(A_1)$$

Thus $\mu(A_1) = \mu(A_2)$, $\mu(E)$ is well defined. Next, let us verify that $\mathfrak{M}^*$ has the three defining properties of a σ -algebra.

1. It is clearly that $X \in \mathfrak{M}^*$.
2. If $A \subseteq E \subseteq B$, then $B^c \subseteq E^c \subseteq A^c$. And since $\mu(A^c - B^c) = \mu(A^c \cap B) = \mu(B - A) = 0$, $E^c \in \mathfrak{M}^*$.
3. Suppose $A_i \subseteq E_i \subseteq B_i$, $i = 1, 2, \dots$, where $A_i, B_i \in \mathfrak{M}$, $\mu(B_i - A_i) = 0$.

Let $E = \bigcup E_i, A = \bigcup A_i, B = \bigcup B_i$. Since

$$B - A = \bigcup_i (B_i - A) \subseteq \bigcup_i (B_i - A_i)$$

,

$$\mu(B - A) \leq \sum_i \mu(B_i - A_i) = 0$$

Then by $A \subseteq E \subseteq B$, it follows that $E \in \mathfrak{M}^*$.

Finally, we show the countable additive of μ . If the above sets E_i are disjoint, the same is true of the sets A_i , then

$$\mu(E) = \mu(A) = \sum_i \mu(A_i) = \sum_i \mu(E_i)$$

□

Definition 1.6.5 ▶ More Measurable Functions

We say a function f defined on a set $E \in \mathfrak{M}$ is **measurable on X** . If $\mu(E^c) = 0$ and if $f^{-1}(V) \cap E$ is a measurable for every open set V .

Remark.

- If we define $f(x) = 0$ for $x \in E^c$, we obtain a measurable function on X , in the old sense.
- If our measure happens to be complete, we can define f on E^c in a perfectly arbitrary manner, and we still get a measurable function. The integral of f over any set $A \in \mathfrak{M}$ is independent of the definition of f on E^c ; therefore this definition need not even be specified at all.

Theorem 1.6.6

Suppose $\{f_n\}$ is a sequence of complex measurable functions defined a.e. on X such that

$$\sum_{n=1}^{\infty} \int_X |f_n| d\mu < \infty. \quad (1)$$

Then the series

$$f(x) = \sum_{n=1}^{\infty} f_n(x) \quad (2)$$

converges for almost all x , $f \in L^1(\mu)$, and

$$\int_X f \, d\mu = \sum_{n=1}^{\infty} \int_X f_n \, d\mu. \quad (3)$$

Remark.

- 现在, 考察积分和求和是否可交换, 只需要检查模长积分的级数是否收敛.
- 即便 f_n 在 X 上处处被定义, 级数收敛的地方也只是 *almost everywhere*.

Note.

此时, 控制函数就是绝对级数本身, 它在一个满测集上将原级数控制住. 其特殊性间接给出了原级数的几乎处处收敛性质.

Proof. Let S_n be the set on which f_n is defined, so that $\mu(S_n^c) = 0$. Let $S = \bigcap S_n$. Put $\varphi(x) = \sum |f_n(x)|$, for $x \in S$. By Monotone Convergence Theorem

$$\int_S \varphi \, d\mu \leq \sum_{n=1}^{\infty} \int_S |f_n| \, d\mu < \infty$$

Let $E = \{x \in S : \varphi(x) < \infty\}$. Then it follows that $\mu(E^c) = 0$. We have

$$\sum_{n=1}^{\infty} |f_n(x)| < \infty, \quad \forall x \in E$$

Thus

$$f(x) = \sum_{n=1}^{\infty} f_n(x)$$

converges on E , which is a set with its complement measure zero. That is to say f converges for almost all x . And since $f \in L^1(\mu|_E)$, $\mu(E) = 0$, we have

$f \in L^1(\mu)$. Finally, by Monotone Convergence Theorem,

$$\int_X f \, d\mu = \int_E f \, d\mu = \sum_{n=1}^{\infty} \int_E f_n \, d\mu = \sum_{n=1}^{\infty} \int_X f_n \, d\mu$$

□

Theorem 1.6.7

1. Suppose $f : X \rightarrow [0, \infty]$ is measurable, $E \in \mathfrak{M}$, and $\int_E f \, d\mu = 0$. Then $f = 0$ a.e. on E .
2. Suppose $f \in L^1(\mu)$ and $\int_E f \, d\mu = 0$ for every $E \in \mathfrak{M}$. Then $f = 0$ a.e. on X .
3. Suppose $f \in L^1(\mu)$ and

$$\left| \int_X f \, d\mu \right| = \int_X |f| \, d\mu$$

Then there is a constant α such that $\alpha f = |f|$ a.e. on X .

Note.

3. 这个积分等式的意义是不存在积分项因方向改变产生的损耗. 结论就是说如果这种损耗不存在, 那么 f 几乎不改变方向.

Proof. 1. Let $A_n = \left\{ x \in E : f(x) \geq \frac{1}{n} \right\}$. Then

$$0 = \int_E f \, d\mu \geq \int_{A_n} f \, d\mu \geq \mu(A_n) \frac{1}{n}.$$

It follows that

$$\mu(A_n) = 0, \quad \forall n = 1, 2, \dots$$

Let $A = \bigcup_{n=1}^{\infty} A_n$. Then $\mu(A) = 0$, and $f \equiv 0$ on $E \setminus A$. Thus $f = 0$ a.e. on E .

2. Suppose $f = u + iv$. Let $E = \{x \in X : u(x) \geq 0\}$. Since $\operatorname{Re} f = u^+$ on E , then

$$\int_E u^+ \, d\mu = 0$$

It follows by 1. that $\mu^+ = 0$ a.e. on E . Since $\mu^+(X \setminus E) \equiv 0$, $\mu^+ = 0$ a.e.

on X . We conclude similarly that

$$u^- = v^+ = v^- = 0, \quad a.e.$$

3. Let $z = \int_X f d\mu$. Then z is a complex number. Take $\alpha = \bar{z}/|z|$. Then

$$\alpha z = |z| = \left| \int_X f d\mu \right|$$

Where

$$\alpha z = \alpha \int_X f d\mu = \int_X \alpha f d\mu$$

It follows that

$$\int_X \alpha f d\mu = \left| \int_X f d\mu \right| = \int_X |f| d\mu \implies \int_X (\alpha f - |f|) d\mu = 0$$

which shows that

$$\alpha f = |f|, \quad a.e. \text{ on } X$$

□

Theorem 1.6.8

Suppose $\mu(X) < \infty$, $f \in L^1(\mu)$, S is a closed set in the complex plane, and the averages

$$A_E(f) = \frac{1}{\mu(E)} \int_E f d\mu$$

lie in S for every $E \in \mathfrak{M}$ with $\mu(E) > 0$. Then $f(x) \in S$ for almost all $x \in X$.

Proof. Let Δ be circular disk, with centre α and radius r . And suppose that Δ lies in S^c . S^c can be written as the union of countably many such disks. Thus, we only need to show that $\mu(E) = 0$, where $E = f^{-1}(\Delta)$. If $\mu(E) > 0$, then

$$|A_E(f) - \alpha| = \frac{1}{\mu(E)} \left| \int_E (f - \alpha) d\mu \right| \leq \frac{1}{\mu(E)} \int_E |f - \alpha| d\mu \leq r$$

Which leads to a contradiction, since $A_E(f) \in S$. Hence $\mu(E) = 0$. □

Theorem 1.6.9

Let $\{E_k\}$ be a sequence of measurable sets in X , such that

$$\sum_{k=1}^{\infty} \mu(E_k) < \infty.$$

Then almost all $x \in X$ lie in at most finitely many of the sets E_k .

Proof. Let

$$g(x) = \sum_{k=1}^{\infty} \chi_{E_k}(x)$$

Then g is measurable. By Monotone Convergence Theorem,

$$\int_X g(x) \, d\mu = \sum_{k=1}^{\infty} \int_X \chi_{E_k}(x) \, d\mu = \sum_{k=1}^{\infty} \mu(E_k) < \infty$$

Thus $g \in L^1(\mu)$. There is a $E \in \mathfrak{M}$, $\mu(E^c) = 0$, such that $g^{-1}(\infty) \cap E = \emptyset$. If $x \in X$ lie in infinitely many of the sets E_k . Then $g(x) = \infty$, it follows that $x \in E^c$. Thus, points that lie in infinitely many of the sets E_k will always lie in E^c as well, whose measure is zero. $\square$

1.7 Exercises

Note.

关于积分的问题有两种常用标准技巧。一种是按取值划分集合。一种用可控的函数列逼近。

Problem 1.7.1

Does there exist an infinite σ -algebra which has only countably many members?

Proof.

$\square$

Problem 1.7.2

Prove that if f is a real function on a measurable space X such that $\{x : f(x) \geq r\}$ is measurable for every rational r , then f is measurable.

Proof. Take any real number a . We have

$$f^{-1}((a, \infty]) = \bigcup_{r \in \mathbb{Q}, r > a} f^{-1}([r, \infty])$$

which is a countably many union of measurable sets. Thus $f^{-1}((a, \infty])$ is measurable for all a . It follows that f is measurable. $\square$

Problem 1.7.3

Let $\{a_n\}$ and $\{b_n\}$ be sequences in $[-\infty, \infty]$, and prove the following assertions:

(a)

$$\limsup_{n \rightarrow \infty} (-a_n) = -\liminf_{n \rightarrow \infty} a_n.$$

(b)

$$\limsup_{n \rightarrow \infty} (a_n + b_n) \leq \limsup_{n \rightarrow \infty} a_n + \limsup_{n \rightarrow \infty} b_n$$

provided none of the sums is of the form $\infty - \infty$.

(c) If $a_n \leq b_n$ for all n , then

$$\liminf_{n \rightarrow \infty} a_n \leq \liminf_{n \rightarrow \infty} b_n.$$

Show by an example that strict inequality can hold in (b).

Proof. 1.

$$\limsup_{n \rightarrow \infty} (-a_n) = \lim_{n \rightarrow \infty} \sup_{k \geq n} \{-a_k\} = -\lim_{n \rightarrow \infty} \inf_{k \geq n} \{a_k\} = -\liminf_{n \rightarrow \infty} a_n$$

2.

$$\begin{aligned}
\limsup_{n \rightarrow \infty} (a_n + b_n) &= \lim_{n \rightarrow \infty} \sup_{k \geq n} \{a_k + b_k\} \\
&\leq \lim_{n \rightarrow \infty} \left(\sup_{k \geq n} \{a_k\} + \sup_{k \geq n} \{b_k\} \right) \\
&= \lim_{n \rightarrow \infty} \sup_{k \geq n} \{a_k\} + \lim_{n \rightarrow \infty} \sup_{k \geq n} \{b_k\} \\
&= \limsup_{n \rightarrow \infty} a_n + \limsup_{n \rightarrow \infty} b_n
\end{aligned}$$

Let $\{a_n\} = \{(-1)^n\}$, $\{b_n\} = \{(-1)^{n+1}\}$. Then the RHS of the inequality is $1 + 1 = 2$. The LHS is 0.

3. If $a_n \leq b_n$ for all n , then

$$\inf_{k \geq n} \{a_k\} \leq \inf_{k \geq n} \{b_k\}$$

Thus

$$\liminf_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \inf_{k \geq n} \{a_k\} \leq \lim_{n \rightarrow \infty} \inf_{k \geq n} \{b_k\} = \liminf_{n \rightarrow \infty} b_n$$

□

Problem 1.7.4

(a) Suppose $f : X \rightarrow [-\infty, \infty]$ and $g : X \rightarrow [-\infty, \infty]$ are measurable. Prove that the sets

$$\{x : f(x) < g(x)\}, \{x : f(x) = g(x)\}$$

are measurable.

(b) Prove that the set of points at which a sequence of measurable real-valued functions converges (to a finite limit) is measurable.

Proof. 1. Let

$$h = \begin{cases} g - f, & x \in f^{-1}((-\infty, \infty)) \\ 0, & f(x) = g(x) = -\infty \\ 0, & f(x) = g(x) = \infty \\ -1, & f(x) = \infty, g(x) < \infty \\ 1, & f(x) = -\infty, g(x) > -\infty \end{cases}$$

It is easy to see that h is measurable. Thus

$$\{x : f(x) < g(x)\} = h^{-1}((0, \infty])$$

is measurable. And

$$\{x : f(x) = g(x)\} = h^{-1}(0)$$

is measurable.

2. Let $\{f_n\}$ be a sequence of measurable real-valued functions. Take $x \in X$. $\{f_n(x)\}$ is converges. If and only if for any $k \in \mathbb{N}$, there exists $N \in \mathbb{N}$, such that for all $m, n \geq N$, $|f_m(x) - f_n(x)| \leq \frac{1}{k}$. That is to say

$$\{x : \{f_n(x)\} \text{ converges} \} = \bigcap_{k=1}^{\infty} \bigcup_{N=1}^{\infty} \bigcap_{m=N}^{\infty} \bigcap_{n=N}^{\infty} (|f_m - f_n|)^{-1}\left((-\infty, \frac{1}{k}]\right)$$

which is a measurable set.

□

Problem 1.7.5

Let X be an uncountable set, let $\mathfrak{M}$ be the collection of all sets $E \subset X$ such that either E or E^c is at most countable, and define $\mu(E) = 0$ in the first case, $\mu(E) = 1$ in the second. Prove that $\mathfrak{M}$ is a σ -algebra in X and that μ is a measure on $\mathfrak{M}$. Describe the corresponding measurable functions and their integrals.

Proof. We will first show $\mathfrak{M}$ is a σ -algebra step by step.

1. It is clear that if $E \in \mathfrak{M}$, E^c is as well.
2. Let $E_1, E_2, \dots$ be members of $\mathfrak{M}$. If all of E_n is countable, then $\bigcup_{n=1}^{\infty} E_n$ is at most countable. Otherwise, we may assume that E_1 is uncountable, then E_1^c is at most countable.

$$X \setminus \bigcup_{n=1}^{\infty} E_n = E_1^c \cap \bigcap_{n=2}^{\infty} E_n^c$$

is at most countable. Hence $\bigcup_{n=1}^{\infty} E_n \in \mathfrak{M}$.

3. Since $\emptyset$ is at most countable, $X \in \mathfrak{M}$.

The above shows that $\mathfrak{M}$ is a σ -algebra. To see μ is a measure, take $E_1, E_2, \dots \in \mathfrak{M}$ with any two of them have empty intersection. If all of E_n is countable, then $\bigcup_{n=1}^{\infty} E_n$ is as well. We have

$$\sum_{n=1}^{\infty} \mu(E_n) = 0 = \mu\left(\bigcup_{n=1}^{\infty} E_n\right)$$

If one of the sets E_n is uncountable, say E_1 . If $E_i, i \geq 2$ is uncountable.

$$X = (\emptyset)^c = (E_1 \cap E_2)^c = E_1^c \cup E_2^c$$

is at most countable, which leads to a contradiction. Thus $E_i, i \geq 2$ is at most countable. Hence

$$\sum_{n=1}^{\infty} \mu(E_n) = 1 + 0 + \dots + 0 = 1 = \mu\left(\bigcup_{n=1}^{\infty} E_n\right).$$

It follows that μ is a measure on $\mathfrak{M}$, since $\mu(\emptyset) = 0$.

To describe the measurable functions. If f is not *a.e.* constant, then there are two value a, b of f , such that $f^{-1}(a), f^{-1}(b)$ is uncountable. Then

$$f^{-1}(b) \subseteq (f^{-1}(a))^c$$

is at most countable, which leads to a contradiction. Thus f is *a.e.* constant. Take any measurable function f . Suppose that $E = f^{-1}(c), \mu(E) \neq 0$. Then $\mu(E^c) = 0$. It follows that f is integrable and

$$\int_X f \, d\mu = \int_E f \, d\mu = c\mu(E) = c$$

□

Problem 1.7.6

Suppose $f_n : X \rightarrow [0, \infty]$ is measurable for $n = 1, 2, 3, \dots$, $f_1 \geq f_2 \geq f_3 \geq \dots \geq 0$, $f_n(x) \rightarrow f(x)$ as $n \rightarrow \infty$, for every $x \in X$, and $f_1 \in L^1(\mu)$. Prove that then

$$\lim_{n \rightarrow \infty} \int_X f_n \, d\mu = \int_X f \, d\mu$$

and show that this conclusion does not follow if the condition " $f_1 \in L^1(\mu)$ " is omitted.

Proof. Let $g_n = f_1 - f_n$, then

$$0 = g_1 \leq g_2 \leq \cdots, \quad g_n(x) \rightarrow f_1(x) - f(x) \text{ as } n \rightarrow \infty$$

Applying the Monotone Convergence Theorem to $\{g_n\}$, we have

$$\int_X f_1 d\mu - \lim_{n \rightarrow \infty} \int_X f_n d\mu = \lim_{n \rightarrow \infty} \int_X g_n d\mu = \int_X (f_1 - f) d\mu = \int_X f_1 d\mu - \int_X f d\mu$$

Since $\int_X f_1 d\mu < \infty$, subtracting $\int_X f_1 d\mu$ both sides, we have

$$\lim_{n \rightarrow \infty} \int_X f_n d\mu = \int_X f d\mu.$$

Let $X = \mathbb{R}$ with borel measure, and let $f_n = \chi_{\mathbb{R} \setminus [0, n]} \frac{1}{n}$. Then $f_n(x) \rightarrow f(x) = 0$, $\int_X f d\mu = 0$. But

$$\int_X f_n d\mu = \infty, \quad \forall n$$

Thus the condition " $f_1 \in L^1(\mu)$ " can not be omitted. □

Problem 1.7.7

Put $f_n = \chi_E$ if n is odd, $f_n = 1 - \chi_E$ if n is even. What is the relevance of this example to Fatou's lemma?

Proof.

$$\liminf_{n \rightarrow \infty} f_n(x) \equiv 0, \quad \int_X \liminf_{n \rightarrow \infty} f_n d\mu = 0$$

$$\int_X f_n d\mu = \begin{cases} \mu(E), & n \text{ is odd} \\ \mu(X \setminus E), & n \text{ is even} \end{cases}$$

$$\liminf_{n \rightarrow \infty} \int_X f_n d\mu = \min \{ \mu(E), \mu(X \setminus E) \}$$

□

Problem 1.7.8

Suppose μ is a positive measure on X , $f : X \rightarrow [0, \infty]$ is measurable, $\int_X f d\mu = c$, where $0 < c < \infty$, and α is a constant. Prove that

$$\lim_{n \rightarrow \infty} \int_X n \log[1 + (f/n)^\alpha] d\mu = \begin{cases} \infty & \text{if } 0 < \alpha < 1, \\ c & \text{if } \alpha = 1, \\ 0 & \text{if } 1 < \alpha < \infty. \end{cases}$$

Hint: If $\alpha \geq 1$, the integrands are dominated by αf . If $\alpha < 1$, Fatou's lemma can be applied.

Proof. By differentiating $\frac{1}{y} \log(1 + ky)$. We know $n \log\left(1 + \frac{f}{n}\right)$ is increasing as n is increasing. By Monotone Convergence Theorem,

$$\lim_{n \rightarrow \infty} \int_X n \log\left[1 + \left(\frac{f}{n}\right)\right] d\mu = \int_X \lim_{n \rightarrow \infty} n \log\left[1 + \frac{f}{n}\right] d\mu = \int_X f d\mu = c$$

. If $\alpha > 1$, then note that

$$0 \leq n \log\left[1 + \left(\frac{f}{n}\right)^\alpha\right] \leq \alpha f, \quad \int_X \alpha f d\mu = \alpha c < \infty$$

The Dominated Convergence Theorem gives that

$$\lim_{n \rightarrow \infty} \int_X n \log\left[1 + \left(\frac{f}{n}\right)^\alpha\right] d\mu = \int_X \lim_{n \rightarrow \infty} n \log\left[1 + \left(\frac{f}{n}\right)^\alpha\right] d\mu = 0$$

If $\alpha < 1$, the Fatou's Lemma gives that

$$\lim_{n \rightarrow \infty} \int_X n \log\left[1 + \left(\frac{f}{n}\right)^\alpha\right] d\mu \geq \int_X \lim_{n \rightarrow \infty} n \log\left[1 + \left(\frac{f}{n}\right)^\alpha\right] d\mu = \int_X \infty d\mu = \infty$$

□

Problem 1.7.9

Suppose $\mu(X) < \infty$, $\{f_n\}$ is a sequence of bounded complex measurable

functions on X , and $f_n \rightarrow f$ uniformly on X . Prove that

$$\lim_{n \rightarrow \infty} \int_X f_n d\mu = \int_X f d\mu,$$

and show that the hypothesis " $\mu(X) < \infty$ " cannot be omitted.

Proof. Take any $\varepsilon > 0$,

$$\lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu \leq \mu(X) \varepsilon$$

Let $\varepsilon \rightarrow 0$, we have

$$\lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu = 0$$

Thus

$$\left| \lim_{n \rightarrow \infty} \int_X f_n d\mu - \int_X f d\mu \right| \leq \lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu = 0$$

Let $f_n = \chi_{[0,n]} \frac{1}{n}$. Then $f = 0$,

$$\lim_{n \rightarrow \infty} \int_X f_n d\mu = 1$$

$$\int_X f d\mu = 0$$

Thus $\mu(X) < \infty$ cannot be omitted. □

Problem 1.7.10

Let $\{E_k\}$ be a sequence of measurable sets in X , such that

$$\sum_{k=1}^{\infty} \mu(E_k) < \infty.$$

Suppose A is the set of all x which lie in infinitely many E_k . Show that

$$A = \bigcap_{n=1}^{\infty} \bigcup_{k=n}^{\infty} E_k$$

Then almost all $x \in X$ lie in at most finitely many of the sets E_k .

Proof. $x \in A^c$ iff there exists $k \in \mathbb{N}$, such that for all $n \geq k$, $x \in E_k^c$. That is

$$A^c = \bigcup_{k=1}^{\infty} \bigcap_{n=k}^{\infty} E_k^c$$

Thus

$$A = \bigcap_{k=1}^{\infty} \bigcup_{n=k}^{\infty} E_k$$

$$\mu(A) = \lim_{k \rightarrow \infty} \mu\left(\bigcup_{n=k}^{\infty} E_k\right) \leq \lim_{k \rightarrow \infty} \sum_{n=k}^{\infty} \mu(E_k) = \left(\sum_{k=1}^{\infty} \mu(E_k) - \lim_{k \rightarrow \infty} \sum_{m=1}^k \mu(E_k)\right) = 0$$

□

Problem 1.7.11

Suppose $f \in L^1(\mu)$. Prove that to each $\epsilon > 0$ there exists a $\delta > 0$ such that $\int_E |f| d\mu < \epsilon$ whenever $\mu(E) < \delta$.

Proof. Let

$$f_n := \min\{|f|, n\}$$

Then

$$0 \leq f_1 \leq f_2 \leq \dots, \quad f_n \rightarrow |f| \text{ as } n \rightarrow \infty$$

$$\int_E |f| d\mu \leq \lim_{n \rightarrow \infty} \int_X f_n d\mu$$

There exists $N \in \mathbb{N}$, such that

$$\int_E |f| d\mu \leq \int_E f_N d\mu + \frac{\epsilon}{2} \leq \mu(E)N + \frac{\epsilon}{2} \leq \epsilon$$

whenever $\mu(E) < \delta := \frac{\varepsilon}{2N}$

□

Problem 1.7.12

If $f \geq 0$, then

$$\int_E \infty \cdot f \, d\mu = \infty \cdot \int_E f \, d\mu.$$

Proof. Let $E_1 = f^{-1}(0) \cap E$, $E_2 = E \setminus E_1$.

1. If $\mu(E_2) > 0$ Then

$$\int_E \infty \cdot f \, d\mu \geq \int_{E_2} \infty \cdot f \, d\mu = \infty$$

$$\int_E f \, d\mu \geq \int_{E_2} f \, d\mu > 0, \quad \infty \cdot \int_E f \, d\mu = \infty$$

2. If $\mu(E_2) = 0$, then

$$\int_E \infty \cdot f \, d\mu = \int_{E_1} \infty \cdot 0 \, d\mu + \int_{E_2} \infty \cdot f \, d\mu = 0$$

$$\int_E f \, d\mu = \int_{E_1} 0 \, d\mu + \int_{E_2} f \, d\mu = 0, \quad \infty \cdot \int_E f \, d\mu = 0$$
